                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                     The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at lesst 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a prometer at least 70% identical to DMTs flanking sequence, DMTs flanking sequence or an 5° untranslated region of DMT, a host cell comprising an exceptions polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein into a cell results in modulation of methylation of the protein into a cell results in modulation of methylation of the protein into a cell results in modulated expression of the protein in a hanneed endosperm development and expressing of the component and expression of the DEMETER is related to 5-methylcytosine glycosylasses and regulates and requiates and requiates and represent and expression of the protein in a nample of the content of the protein of target genes by demethylation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2;

The invention features to an isolated polymeracture at least 40% identical to DMT (DEMTER, previously known as ATROPOS (ATR)) Domain A, B complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMTER, previously known as ATROPOS (ATR)) Domain A, B cr C or their compinations. Also included are an expression cassette comprising the polymeractice or comprising a heterologues polymeractic demonstrating sequence, DMT 3. flanking sequence or an 5. untranslated region of DMT, a host cell comprising an exogenous polymeracing a crossing a DMT-like protein and a transgenic plant comprises introducing encoding a DMT-like protein. The expression cassette is polymeractic encoding a DMT-like protein. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual tross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polymeracticities useful for detecting a nucleic acid in a sample. The polymeracticities a DMT-like protein. The present reputates

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 3225, Application US/09134001C
Patent No. 6380370
GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCC
TITLE OF INVENTION: EPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC-007
CURRENT APPLICATION NUMBER: US/09/134,001C
CURRENT FILING DATE: 1997-11-08
PRIOR APPLICATION NUMBER: US 60/064,964
PRIOR APPLICATION NUMBER: US 60/055,779
PRIOR PEDICATION NUMBER: US 60/055,779

; TYPE: PRT ; ORGANISM: Staphylococcus epidermidis US-09-134-001C-3225

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (AUG-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: HAS BOTH AN APURINIC AND/OR APYRIMIDINIC ENDONUCLEASE
ACTIVITY AND A DNA N-GLYCOSYLASE ACTIVITY (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or apyrimidinic site in DNA is broken by a beta-elimination reaction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Caenorhabditis elegans.

C. PUNCTION: DNA REPRIXE REXYME THAT INCISES DNA AT 8-OXG RESIDUES. EXCISES 7.8-DIMYDRO-8-OXGGINANINE AND 2.6-DIAMINO-4-HYDROXY-5-N-METHYLFORMAMIDOPMINIDINE (RAPY) FROM DAMAGED DNA. HAS A BETALYLFORMAMIDOPMINIDINE (RAPY) FROM DAMAGED UNA. HAS A BETALYLFORMAMIDOPMINITY: Endonucleolytic cleavage near apurinic or apyrimidaline sites to products with 5'-phosphate.

Effect of single mutations in the OGG1 gene found in human tumors of the substrate specificity of the Ogg1 protein.";
Nucleic Acids Res. 28:3672-3678(2000).
I. FUNCTION: DNA REPAINE ENZYME THAT INCISES DNA AT 8-OXOG RESIDUES.
EXCISES 7,8-DIMYDRO-8-OXOGUANINE AND 2,6-DIAMINO-4-HYDROXY-5-N-METHYLFORMAMIDOPYRIMIDINE (FAPY) FROM DAMAGED DNA. HAS A BETA-I-CARALYTIC ACTIVITY: Endonucleolytic cleavage near apurinic or apyrimidianic sites to products with 5'-phosphate.
I. SUBCELLIGAR LOCATION: NUCLEAR (ISOFORM IA) AND MITOCHONDRIAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TIGRFAMS; TIGRO0588; ogg; 1.

-1- FUNCTION: ADERINE GITCOSYLASE ACTIVE ON G-A AND C-A MISPAIRS.
-1- COFACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE CATALYIT CATIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER POSITIONING OF THE BIXEM ALONG THE DNA STRAND (BY SIMILARITY).
-1- SIMILARITY: BELONGS TO THE NTH/MUTY FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                          "Complete genome sequence of Salmonella enterica serovar Typhimurium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IRON-SULFUR (4FE-45) (BY SIMILARITY).

Submitted (AuG-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: DNA REPAIR EMZYME THAT INCISES DNA AT 8-0XOG RESIDUES.
EXCISES 7,8-DIMYDRO-8-OXOGUANINE AND 2,6-DIAMINO-4-HYDROXY-5-N-
NETHYLEORMAMIDOPYRIMIDINE (FARY) FROM DAMAGED DNA. HAS A BETA-
LYASE ACTIVITY THAT NICKS DNA 3' TO THE LESION.
-!- CAMPLYTC ACTIVITY: Endonucleolytic cleavage near apurinic or
apyrimidinic sites to products with 5' phosphate.
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- TISSUE SPECIFICITY: HIGHEST EXPRESSION IN TESTIS.
-!- SIMILARITY: BELONGS TO THE OGGI FAMILY 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prieto Alamo M.J., Jurado J., Francastel E., Laval F.;
"Rat 7,8-dihydro-8-oxoguanine DNA glycosylase: substrate specificity,
kinetics and cleavagemechanism at an apurinic site.";
Nucleic Acids Res. 26:5199-5202(1998).
-!- FUNCTION: DNA REPAIR ENZYME THAT INCISES DNA AT 8-OXOG RESIDUES.
EXCISES 7.8-DIHYDRO-8-OXOGUANINE AND 2,6-DIAMINO-4-HYDROXY-5-N-
METHYLEORMAMIOPYRIMIDINE (FAPY) FROM DAMAGED DNA. HAS A BETA-
LYASE ACTIVITY THAT NICKS DNA 3' TO THE LESION.
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage near apurinic or
apyrimidinic sites to products with 5'-phosphate.
-!- SUBCELLULAR LOCATION:
Nuclear (By similarity).
                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rattus norvegicus (Rat).

Biochemistry 39:1716-1724(2000)
I: FUNCTION: DNA REPAIR ENZYME THAT INCISES DNA AT 8-OXOG RESIDUES.
EXCISES 7,8-DIHYDRO-8-OXOGUANINE AND 2,6-DIAMINO-4-HYDROXY-5-N-METHYLFORMAMIDOPYRIMIDINE (FAPY) FROM DAMAGED DNA. HAS A BETALYABE ACTIVITY THAT NICKS DNA 3' TO THE LESION.
I'VASE ACTIVITY: Endonucleolytic cleavage near apurinic or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FROM THE DAWGED SITE (BY SIMILARITY).

CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or apprinding site in DNA is broken by a beta-elimination reaction, leaving a 3'-terminal unsaturated sugar and a product with a terminal 5'-phosphate.

COPACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER POSITIONING OF THE ENZYBE ALONG THE DNA STRAND (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nelson K.E., Clayton R.A., Gill S.R., Gwinn M.L., Dodson R.J.,

                                                                                          Nature 390:249-256(1997).

-:-CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or apyrimidinic site in DNA is broken by a beta-elimination reaction, leaving a 3'-terminal 1'-terminal 5'-phosphate.

-:-COFACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER POSITIONING OF THE ENTYME ALONG THE DNA STRAND (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA repair;

ACTIVITY AND A DNA N-GLYCOSYLASE ACTIVITY. INCISES DAMAGED DNA AT
CYTOSINES, THYMINES AND GUANINES. ACTS ON A DAMAGED STRAND, 5'
FROM THE DAMAGED SITE (BY SIMILARITY).

--- CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or
apyrimidinic site in DNA is broken by a beta-elimination reaction,
leaving a 3'-terminal unsaturated sugar and a product with a
terminal 5'-phosphate.

--- COFACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE
CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER
POSITIONING OF THE ENTYME ALONG THE DNA STRAND (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PROSITE; PS00764; ENDONUCLEASE_III_1; 1.

The invention relates to human nucleic acids (AAI57798-AAI61369) and
the encoded polypeptides (AAM38642-AAM42213) with nootropic,
the encoded polypeptides (AAM38642-AAM42213) with nootropic,
immunosuppressant and cytostatic activity. The polynuclectides are useful
in gene therapy. A composition containing a polypeptide or polynucleotide
of the invention may be used to treat diseases of the peripheral nervous
system, such as peripheral nervous injuries, peripheral nervous
containsed neuropathies and central nervous system diseases, auch as
localised neuropathies and central nervous system diseases, auch as
Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic
lateral sclerosis, and Shy-Drager Syndrome. Other uses include the
tulisation of the activities such as: Immune system suppression,
Activin/inhibin activity, chemotactic/chemokineic activity, haemostatic
and thrombolytic activity, cancer diagnosis and therapy, drug screening,
assays for receptor activity, arthritis and inflammation, leukaemias and
c.N.S disorders.
Note: The sequence data for this patent did not form part of the printed
specification.
                                                                                                                                                                                                         Example 2; SEQ ID NO 6504; 10078pp; English.

                                                                                                                                                                                                     ö
In gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin, inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and constructions.
                                                                                                                    Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                           Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosls; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activities such as Immune system 'suppression' Activities such as Immune system 'suppression' Activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the cares. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies spolypeptides may be used as antigens in the production of antibodies condequate expression and activity of P. acnes polypeptides and convenient of downrequiate expression and activity of P. acnes polypeptides and categories. These antibodies may also be used as character treat P. acnes infections. The acnes proteins as a canes proteins and activity of P. acnes presence, for example, by acres in a canes proteins and activity of P. acnes presence, for example, by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     enzyme linked immunosorbent assay (ELLSA).
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a polypeptide that is critical for the survival and growth of Candida albicans. The C. albicans nucleic acid molecules encoding the polypeptides of the invention may be used as probes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

ö
primers for detecting homologous nucleic acid molecule sequences. The polypeptides and nucleic acid molecules and compounds identified as selectively modulating the expression of the polypeptides, may be used as medicaments or for the preparation of a medicament to treat C.albicans associated diseases, especially in AIDS patients and to treat vulvovaginitis in otherwise healthy females. The use of the polypeptides and polynucleotide sequences to treat C.albicans associated diseases has fewer side effects and less toxicity than previously used methods such as the use of amphotericin. This method is therefore especially suitable for immunocompromised patients, such as AIDS patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Wang D;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                            The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA01910) that exhibit activity elating to cytokine. cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy, The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis requiating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Buchrleser C, Frangeul L, Couve E, Rusniok C, Fsihi H, Dehoux P; Dussurget O, Chetouani F, Nedjari H, Glaser P, Kunst F, Cossart P; Daniels J, Goebel W, Kreft J, Kuhn M, Ng E, Vazquez-Boland JA; Dominguez-Bernal G, Garrido-Garcia P, Tierrez-Martinez A, Amend A; Chakraborty T, Domann E, Hain T, Berche P, Charbit A, Durant L; Perez-Diaz J, Baquer F, Garcia Del Portillo F, Gomez-Lopez N; Maduenio E, De Pablos B, Wehland J, Kaerst U, Entian K, Hauf J;

The present invention relates to the genome sequence of Listeria monocytogenes EGD-6 (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes. related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO. at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalnitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyellits), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaries. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention polypeptides may be used as antigens in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                          Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic
                                                                                                                                                                                                                                                                                    downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for

The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH0316 to AAH13628 and AAH18633 to AAH18632 cepresent human cDNA sequences; AAB9446 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AABB5893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; cytokine; cell proliferation; cell differentiation; gene therapy; vacchie; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                    The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length CDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

complement encoding a polypeptide having a sequence at least 40%

identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B

or Cor their combinations. Also included are an expression

cassette comprising the polynuclectide or comprising a heterologous

DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated

cassette comprising an exogenous polynucleotide

DMT 6' flanking sequence, DMT 3' flanking sequence or an 5' untranslated

careding a DMT-like protein. The expression cassette is

cassette flance and atransgenic plant comprising a

cuseful for modulating transcription. The method comprises introducing

the cassette into a host cell with modulated transcription, where

the protein is capable of exhibiting at least one of the following

cross, and selecting a host cell with modulated transcription of the

protein is capable of exhibiting at least one of the following

biological activities, which include enhanced expression of the

protein in a plant results in a delay in flowering time, introduction of

chromosomal DNA in the cell, reduction of expression of the protein in a

plant results in enhanced endosperm development and expression of the

chromosomal DNA in the cell, reduction of expression of the protein in a nathadopsis leaf results in expression of the DNA in the cell, reduction of expression of the Protein in a plant results in enhanced endosperm development and expression of the

CROPETER is related to 5-methyloytosine glycosylases and regulates

changes and selecting a pure of the construction of the present expression of the protein and expression of the modulates

changes and selecting a useful for detecting a nucleic acid in a sample.
